1904. P. Ya. Polubarnova-Kochina, On unsteady motion of soil water seeping from water reservoirs (in Russian), Prikl. Mat. Mekh. 13, 187-206 (Mar.-Apr. 1949).

The paper presents and discusses at length the problem of unsteady seepage in the soil body, caused by a sudden change of the water level in an adjacent reservoir or canal. It is shown that, with some approximations, the problem may be reduced to the nonlinear partial differential equation of Boussinesq. Further approximations are needed to make the latter integrable. This is accomplished most conveniently by reduction to the linear equation of the type encountered in the heat flow, which is later applied to a number of specific cases. Derivation of the seepage equation in the form of the "telegraph equation" is also given.

Most of the specific cases considered belong to the two-dimensional type, with the flow occurring in  $XZ$ -plane. These comprise cases involving the following conditions: (1) The water surface in the ground is horizontal, prior to a sudden change of water level in an adjacent reservoir. The base is horizontal and impervious. (2) The same, except for an additional upward inflow, through a slightly pervious base. Two different conditions with regard to the initial ground-water surface are considered. (3) The impervious bottom is slightly curved. (4) Constant inflow of rain water from above. (5) A three-dimensional problem, similar to problem (1), except for the canal adjacent to the ground, having a dam in it, and the water, after a sudden change, standing at two

different levels on the upstream and the downstream sides in the canal. (6) Two problems of radial flow similar to cases (1) and (4).

A seepage problem involving two different liquids, with the boundary surface between them not deviating greatly from a horizontal plane, is also discussed.

In general the presentation of the subject in the paper is highly mathematical and none too lucid. The resultant expressions for the ground-water surface and discharge are usually given in explicit finite form, sometimes in the form of definite integrals. Only in case (1) are the results illustrated by graphs. The extent of errors produced by various approximations is left unknown, although in case (1) the graphs presented make apparent the discrepancy in solutions arrived at by different methods.

Polubarinova-Kochina, P. Ya. On sources and sinks on a surface Akad. Nauk SSSR. Prikl. Mat. Meh. 14, 57-64 (1950) (Russian).

The present paper deals with the determination of the velocity potential and the stream function for the steady, incompressible, irrotational flow of a fluid on a surface due to a source (or sink) on the surface. The surface is supposed given in parametric form:  $x = f_1(\alpha, \beta)$ ,  $y = f_2(\alpha, \beta)$ ,  $z = f_3(\alpha, \beta)$ . If the parameters  $\alpha$  and  $\beta$  are isothermal, that is

$$ds^2 = \lambda(\alpha, \beta)[d\alpha^2 + d\beta^2],$$

and if further  $\lambda(\alpha, \beta) \equiv 1$ , then the velocity potential  $\varphi$  and the stream function  $\psi$  of a flow on the surface due to a source at the point  $(\alpha_1, \beta_1)$  both satisfy Laplace's equation  $(\partial^2 u / \partial \alpha^2) + (\partial^2 u / \partial \beta^2) = 0$ , and hence

$$\begin{aligned} \varphi(\alpha, \beta) &= \frac{1}{2} \log [(\alpha - \alpha_1)^2 + (\beta - \beta_1)^2] \\ \psi &= \arctan (\beta - \beta_1) / (\alpha - \alpha_1). \end{aligned}$$

This remark is employed to determine  $\varphi$  and  $\psi$  for certain cylindrical surfaces and surfaces of revolution, and for a general ellipsoid. J. B. Diaz (College Park, Md.).

Theory of the movement of ground water [Teoriya  
zemniykh vod], Moscow, Gosud. Izdat. Tekh.-Tekn. Lit.,  
1952, 878 pp.

This well-written and voluminous book is based on the author's lectures at Russian high schools. It is intended as a text book for students of Russian universities and contains two main parts: the first 540 pages are devoted to stationary problems, the remainder to unsteady movement of ground water. The wide scope and variety of problems covered in the book will be clear from the titles of separate chapters.

The first main part contains the following eleven chapters, divided into 162 sections: 1. Mathematical foundation of the theory of groundwater movement; 2. Plane movements in a vertical plane; 3. The pressure filtration below hydrotechnical structures; 4. Joukowski function and its use. Application of functional analysis (viz. to problems of filtration); 5. Use of circular inversion; 6. The mixed problem of the theory of functions and its application in the study of filtration; 7. Use of analytic theory of linear differential equations; 8. Filtration in nonhomogeneous and anisotropic grounds. Filtration of two liquids; 9. Springs and holes. Horizontal drainage. (The last four paragraphs of this chapter deal with some three-dimensional problems of filtration); 10. Hydraulic theory of steady movements; 11. Graphical, numerical, and experimental methods for the study of ground-water movement.

The five chapters of the second main part—11 sections—cover nonstationary problems; 12. Inertial members of unsteady movements; 13. Nonlinear equations of unsteady movements with a free surface; 14. Linear equations of the unsteady movement of groundwater (here again some three-dimensional problems); 15. Plane unsteady movements of groundwater; 16. Approximate numerical and graphical methods for the study of unsteady movements.

2  
Theory of the movement of ground water [Teoriya  
zemniykh vod], Moscow, Gosud. Izdat. Tekh.-Tekn. Lit.,  
1952, 878 pp.

The book closes with a very extensive index of literature (Russian and also some non-Russian) compiled separately for each chapter, followed by a detailed index of subjects treated.

Reviewer believes each page of this work shows the great expertise of its author as well as the excellent role of Russian science in developing and applying mathematical theories to the study of ground-water movements. In spite of its expressly theoretical character, with its systematic use even of the most recent and often rather difficult mathematical expedients, the book gives sufficient emphasis to practical problems. Also welcome is the fact that all mathematical expedients are derived or, at all events, sufficiently explained immediately before the pertinent technical problem.

This successful work will probably be translated into other languages. Reviewer warmly recommends this volume, not only to interested specialists but also to physicists and mathematicians applying their science to advanced problems of engineering.

In the investigation of the speed of the flow of water through a porous medium along the contours of the foundations of hydraulic structures whose cross-sections consist of straight line segments, it is found that at the corners there can exist very large velocities of flow. Such high velocities at any part of the foundation imbedded and floating on a porous medium are very undesirable since their presence can cause deformations in the supporting medium and thus endanger the stability of the structure. When the supporting porous medium is assumed to be of infinite depth, then it had been previously shown that a contour for the cross-section of the support in the form of a semicircle was the best shape in so far as the distribution of the speeds of flow of the water along the support is concerned. In the present paper, for along at the water problem of determining the most desirable smooth contours for the supports of hydraulic structures floating in a porous medium of finite depth. The most desirable contours are taken as those along which the rate of flow is constant. The distributions of velocities along supports whose cross-sections are rectangles with rounded corners and certain other cases are also considered.

ABSTRACT: A survey of the most important results obtained during investigations dealing with steady and unsteady channel seepage processes under conditions of finite, or infinite, depth of ground-water drainage in homogenous and, in some individual instances, nonhomogeneous soils. The author also examines some problems on the seepage from channels under conditions involving flow of two fluids having different densities. Among various problems which may be reduced to the type indicated above are the following: a) The problem of improving salt-contaminated soils by means of flushing; b) the problem of seepage of water from channels into horizontal drainage beds; c) the problem of the dynamics of subterranean waters during irrigation. In the majority of the problems examined the processes of ground-water flow are analyzed qualitatively, whereas in the case of simpler

oil wells (in Russian), Prikl. Mat. Mekh. 20, 1, 92-108,  
Feb. 1956.

Sloping systems of horizontal wells have large application in water  
power plants, whereas slanted wells are mostly used in asphalt  
mines. Author developed theories referring to various conditions  
in horizontal wells on the basis of thorough investigations in the  
Varna water plants with new filtration systems and on discussions  
with the director, V. Vaynsovich, and his assistants, Vl. Sosar-  
ski and V. Kollis, which were published in Archives of applied  
Mechanics, Varna, 7, no. 3, 1955. Application of these theories  
to a slanted well under steady and variable pressure, built in dif-  
ferent strata, is the subject of this paper. Bessel functions are  
used for the solution.

Reference is made to following authors who made similar inves-  
tigations for vertical wells: P. Samsoe, N. K. Gidroki, M.  
Mao, et al., B. I. Segal.

AUTHOR: Polubarinova-Kochina, P.Ya. (Moscow) 40-21-6-7/18

TITLE: On Certain Unsteady Motions of Shallow Water (O nekotorykh neustanovivshikhsya dvizheniyakh "melkoy vody")

PERIODICAL: Prikladnaya Matematika i Mekhanika, 1957, Vol 21, Nr 6,  
pp 783-794 (USSR)

ABSTRACT: After a discussion of the results obtained up to now for the problem of the divergence of heads of liquid, as it can arise e.g. in underwater explosions, the problem is essentially considered to find similar solutions for incompressible liquids. The author shows that the problem of divergence of a head of liquid has certain analogies to the problem of the formation of hills within the ground-water level. The performance of this analogy for the hydraulic case leads to the establishment of equations which correspond to the well-known equations of Bussinesque in the theory of ground-water movements. The author investigates similar solutions of these equations and applies thereby a method elaborated by Sedov for investigating similar solutions of equations of a liquid in a porous medium. It appears that such similar solutions really exist, however, they do not correspond completely to the solutions which are found

Card 1/2

On Certain Unsteady Motions of Shallow Water

40-21-6-7/18

for the problem of the ground-water flows. It is particularly found a solution for the case of the divergence of a constant liquid mass which is combined in a very small range in the initial moment. Some of the obtained results can be transferred to the case of adiabatic motions of gases with the adiabatic exponent  $\gamma = 2$ . There are 6 figures and 10 references, 8 of which are Soviet, and 2 American.

TITLE: Unsteady Percolation on Incomplete Saturation of a Soil (O  
neustanovivsheysya fil'tratsii pri nepoinoy nasyshchennosti  
grunta)

PERIODICAL: Izvestiya Akademii nauk SSSR OTN, Mekhanika i mashino-  
stroyeniye, 1959, Nr 2, pp 57-63 (USSR)

ABSTRACT: The problem considered in the paper is of interest in connec-  
tion with the drainage of water from canals, with the per-  
colation of rainfall, with capillary rise and with the move-  
ment of water in agricultural soils. By inserting the ana-  
lytical expression for Darcy's law in the equation of contin-  
uity, a non-linear differential equation is obtained. This  
equation is simplified by expressing the degree of saturation  
as a power series and limiting the series to two terms. The  
solution of the resulting linear differential equation con-  
tains exponential and error functions, and curves are given  
(Fig 1) showing the distribution of moisture as a function of

Card 1/2

**Unsteady Percolation on Incomplete Saturation of a Soil**

depth and time. By integrating the solution, an equation for total discharge is obtained, and simple approximate expressions corresponding to long and short times are derived which show that the discharge decreases with time and finally attains a constant value. The case of capillary rise is also considered, and the results of the present investigation are compared with those of other workers. There are 3 figures and 12 references, 6 of which are Soviet and 6 English.

TITLE: Investigation of metal corrosion in heat transfer conditions

SOURCE: Zashchita metalla, v. 1, no. 3, 1965, 297-303

TOPIC TAGS: corrosion, corrosion rate, thermodynamic equilibrium, heat transfer

ABSTRACT: It is shown that rotating disc electrodes may be used for simulating the diffusion-dependent corrosion processes which take place in a circular tube during the flow of an aggressive liquid both in conditions of thermal equilibrium and when the liquid is being heated or cooled through the wall. Experimental data indicate that if the wall temperature and the solution temperature are exactly reproduced in the model, then the velocity of the disc which is equivalent to the predetermined linear velocity of the liquid flow may be determined with satisfactory accuracy from Novakovskiy's equation for thermally balanced systems (V. M. Novakovskiy, S. N. Fishman, "Work in the field of Electrochemistry and Corrosion"; Tr. Ural'sk. n.-i.

Orig Pub: Zh. prikl. khimii, 1956, 29, No 5, 698-704

Abstract: It is shown that the starting point of dehydration of bauxite, within the temperature range of 220-470°, depends on the nature of the bauxite and on its grain size. Temperature intervals have been determined which ensure removal of main portion of crystallization water, depending on particle size of bauxite and place of its

P/0056/64/015/006/0805/0817

AUTHOR: Polubiec, A.

TITLE: Incorporation of Fe-59  
into human bone marrow cells in vitro under condi-  
tions of altitude hypoxia

SOURCE: Acta physiologica polonica, v. 15, no. 6, 1964, 805-817

TOPIC TAGS: erythropoiesis,  
altitude

ABSTRACT: The author reports an experimental study of the question whether high-altitude hypoxia can stimulate human bone marrow cells directly to incorporate labelled iron in vitro. For persons 19-31 years old) were chamber where a pressure corresponding to an altitude of 6000 meters above sea level was established. Cont

into human bone marrow cells in vitro under condi-

onica, v. 15, no. 6, 1964, 805-817

bone marrow, radio iron incorporation, hypoxia, high

atmospheric pressure. The following are described: The method of obtaining 2-cc bone marrow samples; the preparation of a bone marrow suspension for incubation; the method of preparing the samples after incubation for radioactivity measurement;

Card 1/3

L 43135-65

ACCESSION NR: AP5002994

and the technique of measuring the radioactivity of the samples after incubation (an electronic LE-5-type counter of Polish production was used and the pulses were counted for 2 minutes). The number of counts for each sample was recalculated to give a result per 10,000 nucleated cells. It was established that the average percentage increase of Fe-59 incorporation with time for the samples in the low-pressure chamber was higher than for the controls incubated under atmospheric pressure; this increase was 43.4% after 24 hours' incubation and 57.1% after 48 hours' incubation. By comparing the average number of counts from the tested samples and from the controls (per unit of time and per 10,000 nucleated cells), it was noted that in both cases the number of counts obtained are discussed in the light of past work in this field, and the following conclusions are drawn: (i) High-altitude hypoxia stimulates human bone marrow cells in vitro to increase the incorporation of labelled iron; (ii) During high-altitude hypoxia, the incorporation of labelled iron into human bone marrow cells in vitro increases with the time of incubation; (iii) An increase in the incorporation of labelled iron with the time of incubation is also observed under conditions of normal atmospheric pressure. TITLE: Oxymethylene Ketones. II. Synthesis of the Alkoxyethylene-cyclohexanones and Their Transformations in the Reduction Reactions (Ref 1)

PERIODICAL: Zhurnal obshchey khimii, 1959, Vol 29, Nr 8,  
pp 2768 - 2772 (USSR)

ABSTRACT: The formation of non-saturated aldehydes mixed with 1,3-glycols in the reduction of the  $\beta$ -dicarbonyl compounds to be enolized with aluminum-lithiumhydride was described by A. Dreiding and J. Hartman (Ref 2). The authors of the present paper found that in place of the  $\beta$ -dicarbonyl compounds the alkoxyethylene- $\beta$ -carbonyl compounds behave in the same way (Ref 3). So the  $\alpha$ -formylcyclohexanone ether (I, R=iso-C<sub>4</sub>H<sub>9</sub>) when reduced with aluminum-lithium hydride at 20° forms the aldehyde (III) with a 70% yield. When reduced with aluminum isopropylate in isopropyl alcohol at 95° (I) also transforms into (III) (24-25%). The reduction with hydrogen at the moment of separation takes place in such a way that all double bonds are satu-

rated. So the reduction of the compounds (I) with sodium in ether containing water leads to the compound (II) (Scheme 1). The ether (II) does not saponify under the influence of the diluted acids and forms derivatives at the hydroxyl group. The authors observed the directions given by L. Růžicka and co-workers (Ref 4) and tried to obtain the acetals of formylcyclohexanone by the effect of the ester of orthoformic acid upon it in the presence of concentrated hydrochloric acid. They then wanted to transform them by a further reduction into the oxyacetals. This reaction, however, failed under the conditions prescribed even when orthophosphoric acid was used instead of concentrated hydrochloric acid as an addition to n-toluene-sulphonic acid. In experiments with ammonium nitrate the ethyl ether of  $\alpha$ -oxymethylenecyclohexanone ( $I, R=C_2H_5$ ) also formed with various yields (Scheme 2). The spectrum analysis confirmed the above results. The figure shows the very similar infrared absorption curves of compounds ( $I, R=iso-C_4H_9$ ) and ( $I, R=C_2H_5$ ). Thus the  $\beta$ -dicarbonyl compounds to be enolized behave ano-

malously in the reaction with orthoformic ester in that they form the ethyl ethers of the enol forms instead of the acetals. The authors conclude by thanking N. A. Preobrazhenskiy, G. I. Samokhvalov for their participation in the discussion of the results, and L. V. Luk'yanova for the photography and interpretation of the infrared spectra. There are 1 figure and 10 references, 1 of which is Soviet.
